

Price Flow Pro Strategy Rules

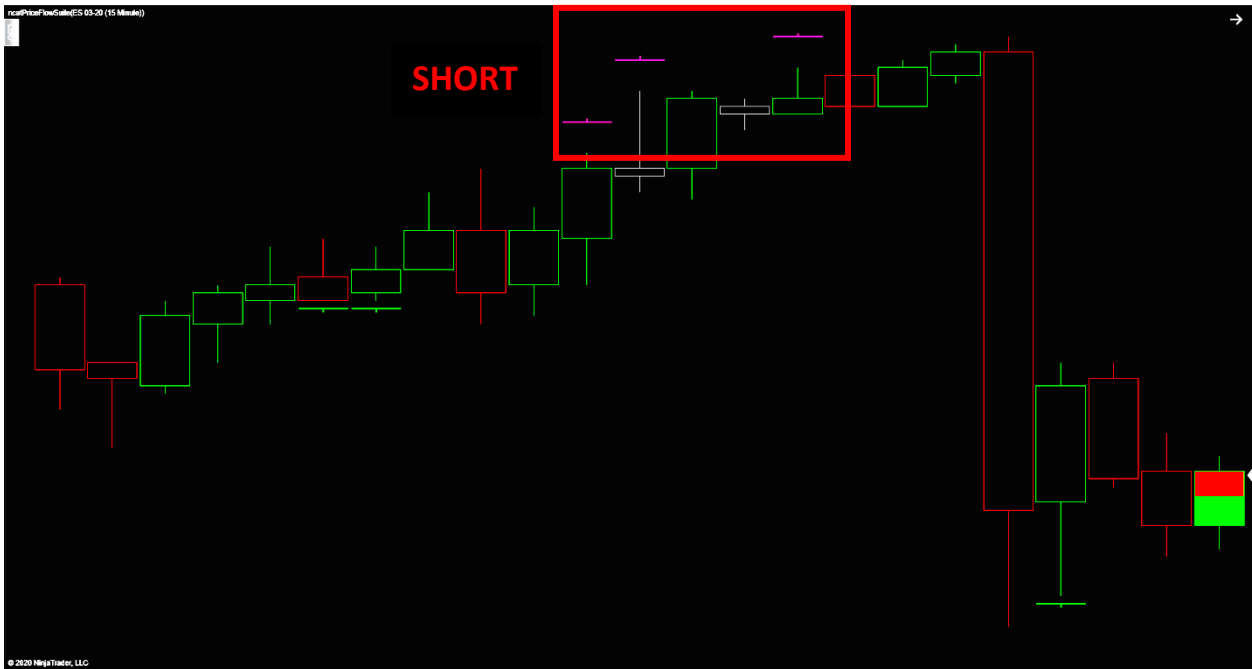

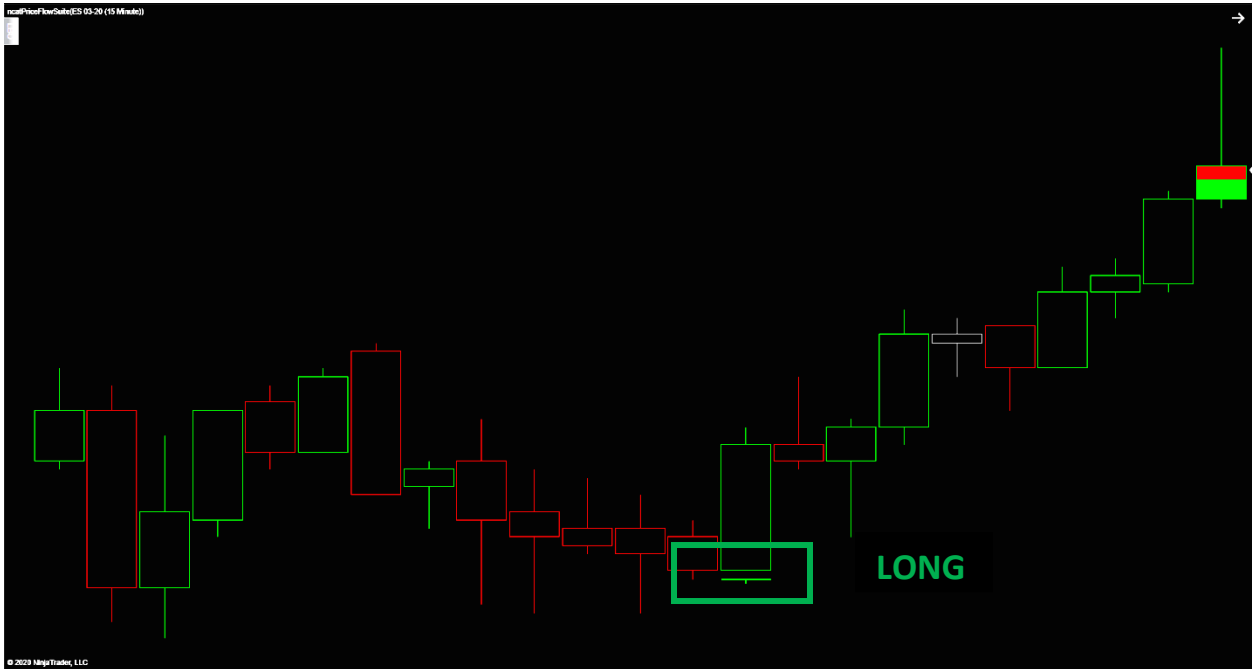

1. Identify a trade location using any of the Price Flow Grid levels
2. Watch for an Entry signal at that location using the Price Flow Suite Order Flow Entry signals
3. Manage the trade either using the order flow or the pressure gauge

Price Flow Pro Strategy

- Open 2 charts with the Price Flow Grid on a higher timeframe chart and the Price Flow Suite on a smaller timeframe chart
- On the higher timeframe chart, do some light market profiling with the focus on finding confluence areas around price. i.e. – An area where a pivot point, grid line, and/or support/resistance areas line up
- On the lower timeframe chart, wait for price to move into your confluence area and for the tool to print a signal
- Execute the trade with stops above the most recent high for a short or low for a long
- Manage the trade using order flow to squeeze as much profit out as you can OR use a target of your choosing

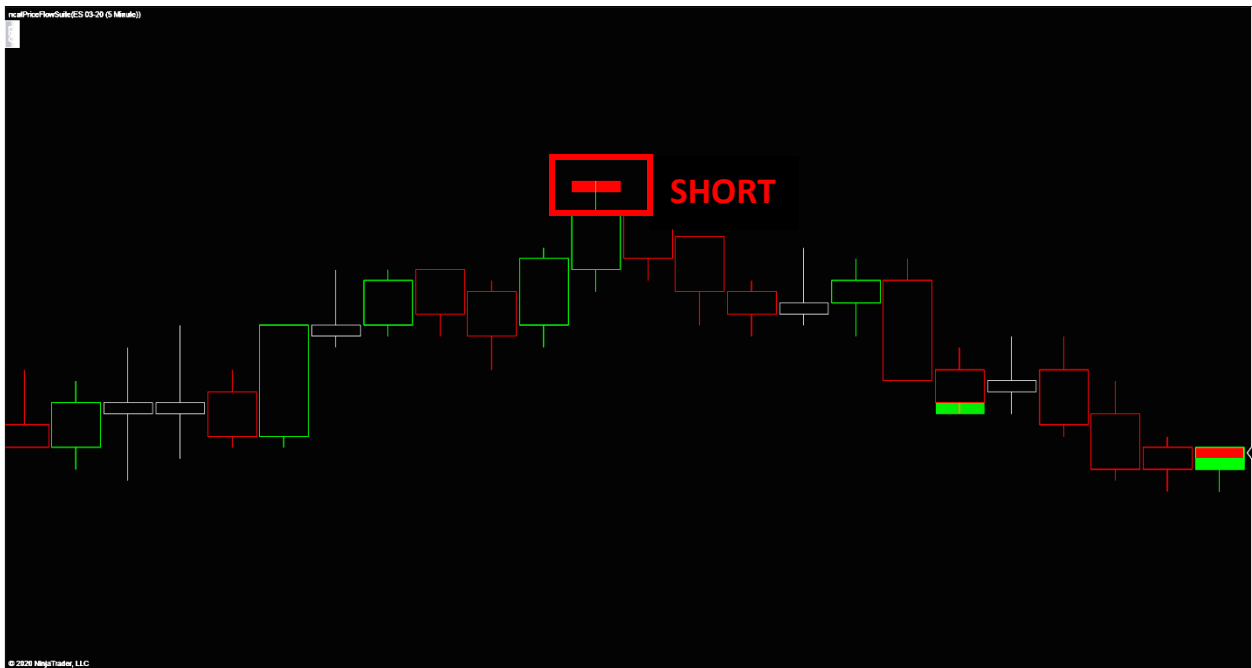

Entry Signals with Descriptions

Liquidation Entry: Built-in oscillator that identifies overbought or oversold market conditions

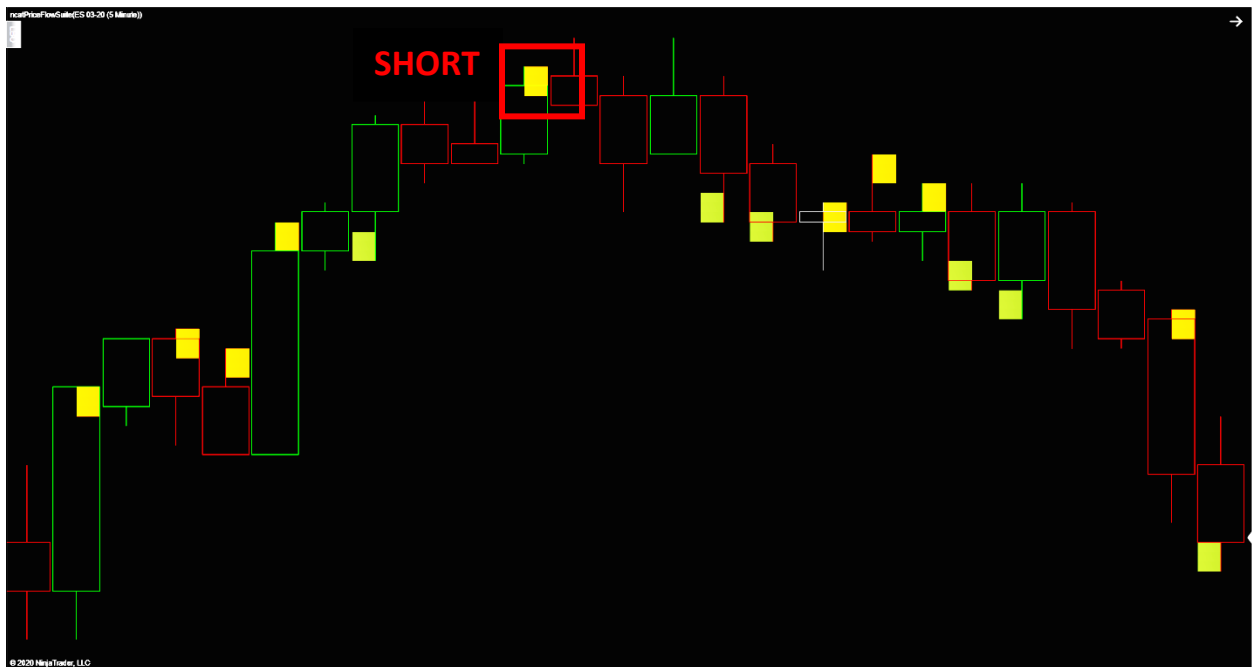

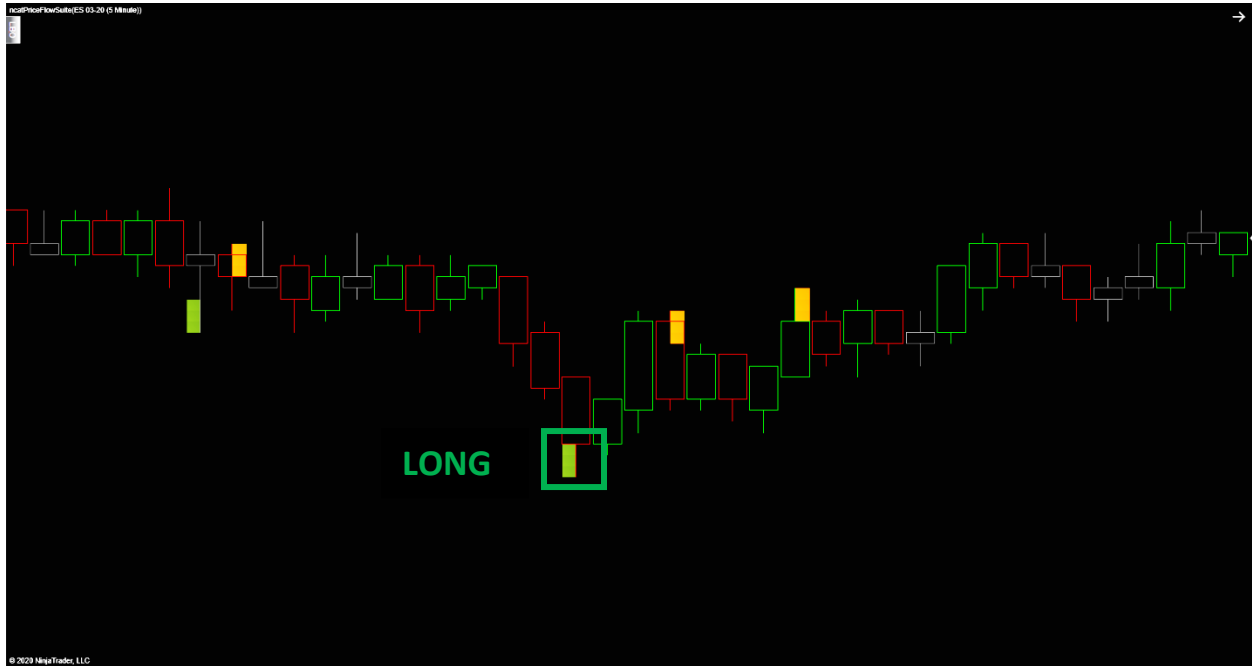

PRICE FLOW PRO STRATEGY GUIDE

Bait and Switch Entry: Identifies trapped traders in the market

PRICE FLOW PRO STRATEGY GUIDE

Sequence Entry: Depicts buying or selling pressure reduction at the extreme of candles

PRICE FLOW PRO STRATEGY GUIDE

Exhaustion Entry: Depicts when one side or the other (buyers vs. sellers) enters the market with an overwhelming amount of orders thus “exhausting” that side of the market

PRICE FLOW PRO STRATEGY GUIDE

Reversal Pierce Entry: Identifies when there is a discrepancy between the type of candle (green bullish vs. red bearish) and the underlying executed orders (order flow). For instance, a signal is generated if you have a green bullish candle but sellers have dominated the order flow by a certain margin.
